Washing without Water: A Comparison (Cost-Benefit)

Materials Consumed

The material needed for conventional personal hygiene consists of two flannels and two towels. As a rule, the washing water is changed once! Alongside the initial costs of purchasing the textiles and the wash bowls, the cost of cleaning and disinfecting them as well as the cost of water disposal all, of course, have to be taken into account.

The Time Factor

32 minutes is an absolutely realistic time-span required for conventional personal hygiene, compared to a mere 19 minutes which are needed for personal hygiene with Washing without Water products! The use of Washing without Water products offer an enormous advantage in time management, especially in wards whose time resources are already stretched to the limit, for example in intensive care, palliative care and geriatrics.

Product

The products completely fulfill the requirements of hygienic personal care. Their skin-caring properties are just as worth highlighting as their packing sizes which are tailor-made to one person's personal hygiene cleansing.

Proof of Effectiveness

Our antibacterial washing gloves and washing bonnets have been tested for their effectiveness at the Dr. Brill + Partner Laboratory for Hygiene and Microbiology. Their effectiveness was ascertained and certified in an assessment according to DIN EN 13624:2004 and DIN EN 13727:2004.

These results were confirmed in a field test in a second user trial.

REF 75.990.00.005

Our antibacterial products not only offer you reliable decontamination, they also ensure excellent skin care and personal hygiene.

REF 75.990.00.015

Use one washing wipe/glove each for the following parts of the body:
